

Python Print Function Practice Questions

1. Basic Printing:

- Write a Python script to print the phrase 'Hello, World!'.
- Print your first name.

2. Printing Multiple Items:

- Print your first name and last name in a single print statement.
- Print the numbers 1, 2, and 3 in a single print statement.

3. Printing Special Characters:

- Print a string that includes a newline character to display text on two lines. For example:

Hello

World

- Print a string that includes a tab character. For example:

Hello World

4. Using the sep Parameter:

- Print three different words separated by commas. For example: 'apple, banana, cherry'.
- Print three different numbers separated by hyphens. For example: '1-2-3'.

5. Using the end Parameter:

- Print two words on the same line with a space in between. For example: 'Hello World'.
- Print the numbers 1 and 2 on the same line without a space in between. For example: '12'.

6. Escape Characters:

- Print a string that includes double quotes. For example: He said, "Hello!".
- Print a backslash character. For example: This is a backslash: \.

7. Combining Text and Numbers:

- Print your age alongside a descriptive message. For example: 'I am 20 years old'.
- Print a number and a string together. For example: 'The number is 5'.

8. Basic Loop for Printing:

- Print the numbers 1 to 5, each on a new line using separate print statements.
